I created the classes, IMS, Artist, State, and Track.

Here are the descriptions for each class:

IMS: This is the driver loop of the program.

Artist: This manages the artists in the library.

Track: This manages the tracks in the library.

State: This manages the data that is stored based on entry and exit to the program.

I tried to focused on using the SRP and naming my variables well. I also implemented the command_table trick that you taught in class allowing me to condense a massive if/else statement.
